Modelling the BookStore Web Application

Re-Architect Approach

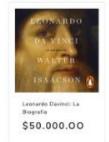

Description

- The application allows you to view a collection of resources, for the purposes of this scenario, "books".
- Likewise, when the user selects one of the resources, a view is offered with detailed information about the selected resource.
- The information of the resources (books) is stored in a database.
- The application has three (views): root ("/", home), detailed description of the resources books and about.

MI TIENDA DE LIBROS INICIO ACERCA DE

Este sido web este concebido como una denda virtual de abras literarias. la qual permite obtener el listado de obras disponibles para reservar y/o comprar. El sido fue desarrollado para que los asuarios pueda obtener información útil acerca de...

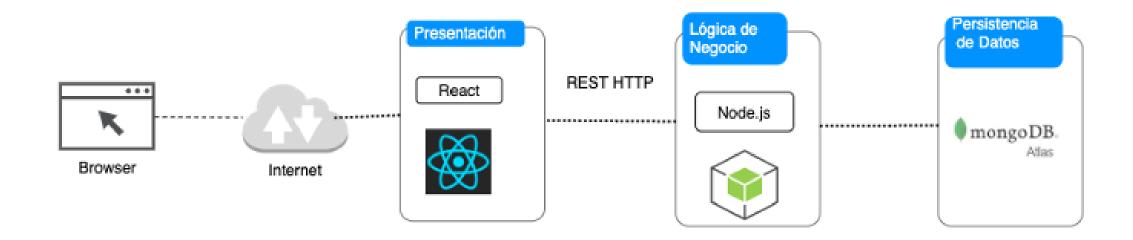

Software Architecture

Architecture Description

- It is a web application which uses a layered architectural style.
- For the purposes of this project, a three (3) layer architecture was defined: presentation layer, business logic and data persistence.
- This is an architectural style that allows each layer to run on top of its own infrastructure.
- Likewise, it is possible for a development team to focus on each layer.

High-Level Architecture

Description

Presentation Layer Description (Front End):

- This layer handles all aspects related to the user interface.
- It is accessed through the browser and is responsible for communication with the back end, in this case using a REST API..
- The presentation layer or front end is developed using React, which is defined as a JavaScript library for developing the presentation layer.
- The main function of React is to render HTML code in the browser.
- For handling styles (CSS), React-Bootstrap is used.

Description(2):

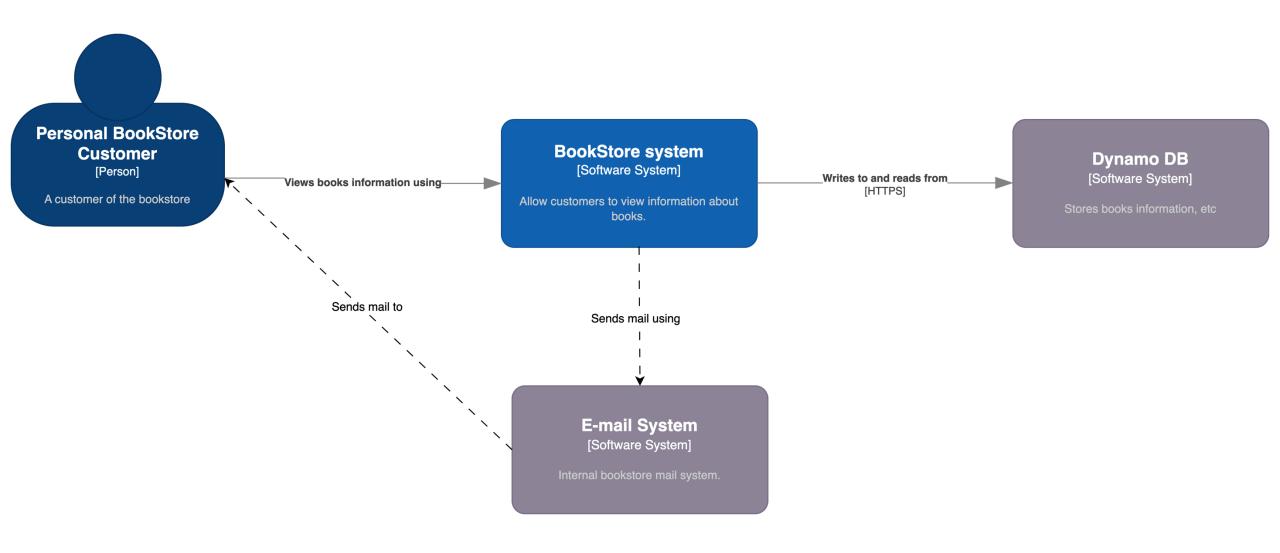

- Back end Description:
- In this architectural style, this is the middle layer where business logic is executed and carried out.
- The back end is developed using server-side scripting technology, in this case, Node.js.
- Additionally, we use a web application development framework called Express and Mongoose for database connection.

Description (3):

- Description of data persistence:
 - In this layer, the information is managed and stored.
 - In this scenario, the data is stored in a document-oriented database engine, specifically MongoDB for the purposes of this application.
 - In particular, we will be using MongoDB Atlas, which is a cloud-based NoSQL Database as a Service (DBaaS).

Component Diagram

Description of the Request Flow

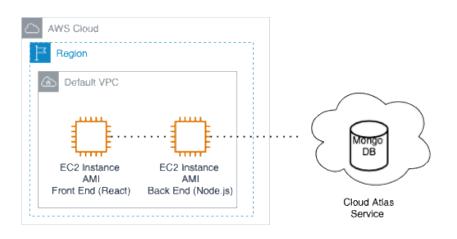

- The "server.js" module initializes the server process on port 5000 and establishes the connection with the database.
- Once it receives HTTP requests, it selects and uses the appropriate route module (bookRoute.js) for processing the incoming HTTP request.
- Here, the information is sent to the appropriate controller ("bookController") so it can fetch the requested data from the front end through the model ("bookModels.js").
- In this case, the response sent back is a JavaScript Object Notation (JSON) to the front end.
- The model is responsible for retrieving the requested data from the database.

Actual Deployment:

Challenge

Challenge

- It is required to propose the following:
 - Fully scalable architecture with high availability for application deployment.
 - The application is required to be dockerized.
 - It is required to be deployed in a Kubernetes cluster using MicroK8s
 - Deliverables:
 - Date: November 25 until 8:00 am using interactiva virtual.
 - A video and document must be submitted.
 - The whole implementation and operation process must be explained in detail, both video and document.
